**ABSTRACT**

**BIOLOGICALLY DRIVEN APPROACH AND THE DIGITAL PATHWAY IN  
THE ESTHETIC ZONE MANAGEMENT:**

**Hard and Soft Tissue Management**

Managing the Esthetic Zone Around Teeth and Implant Is One of The Most Challenging and Demanding Treatments in Dentistry.

Success in the esthetic zone does not mean anymore just to have a fixed restoration above the implant or teeth. Patients are looking nowadays for esthetic and invisible restorations. Pink Esthetic Score is one objective method to evaluate our final outcomes.

After tooth extraction, ridge collapse is a well-accepted phenomenon. Many procedures are described in the literature with high level of success, like ridge preservation; but when we are talking about rebuilt and have long term success, autogenous hard and soft tissue still the gold standard.

During the lecture we will systematize the minimal invasive approach to each case, considering hard and soft tissue augmentation in, rising small and partial thickness flaps and utilizing tunnel techniques, in order to have the best healing patterns and scar less surgery maximizing our esthetics outcomes and how the digital pathway turns the treatments more fast and predictable.
